

Infection – Management and Treatment in Primary Care SWL (Antimicrobial Guidelines)

For use in NHS Sutton, Merton, Wandsworth, Kingston & Richmond boroughs

This guidance is based on the best available evidence but use professional judgement and involve patients

PRINCIPLES OF TREATMENT

1. This guidance should not be used in isolation; it should be supported with patient information about safety netting, delayed/back-up antibiotics, self-care, infection severity and usual duration, clinical staff education, and audits. Materials are available on the [RCGP TARGET](#) website.
2. Prescribe an antibiotic only when there is likely to be a clear clinical benefit, giving alternative, non-antibiotic self-care advice, where appropriate. Limit telephone prescribing to exceptional cases.
3. Always check for antibiotic allergies. Confirm true allergy (i.e. rash, swelling of lips, tongue or face, anaphylaxis, etc.) to recommended antibiotic before prescribing an alternative to ensure appropriate antibiotics are not excluded from the options.
4. Consider a no, or delayed/back up, antibiotic strategy for acute self-limiting upper respiratory tract infections and mild UTI symptoms.
5. In severe infection, or immunocompromised, it is important to initiate antibiotics as soon as possible, particularly if sepsis is suspected. If the patient is not at moderate to high risk for sepsis, give information about symptom monitoring, and how to access medical care if they are concerned.
6. Where an empirical therapy has failed or special circumstances exist, microbiological advice can be obtained from St George's Hospital on ☎ 0208 725 5693, Kingston Hospital on ☎ 020 8934 2052 or St Helier Hospital on ☎ 020 8296 2468.
7. Use simple generic antibiotics first if possible. Avoid broad spectrum antibiotics (e.g. co-amoxiclav, quinolones and cephalosporins) when narrow spectrum antibiotics remain effective, as they increase the risk of *Clostridium difficile*, MRSA and resistant UTIs.
8. Modify suggested adult doses/duration for age, weight and renal function. Consider a larger dose or longer course in severe or recurrent cases. Doses are for guidance only, are oral and for adults unless otherwise stated. Children's doses are provided when appropriate and can be accessed through the [BNFc](#) symbol. Refer to the BNF for further dosing and interaction information (e.g. interaction between macrolides and statins, clozapine and ciprofloxacin, etc) if needed. Check for hypersensitivity.
9. The use of new and more expensive antibiotics (e.g. quinolones and cephalosporins) is inappropriate when standard and less expensive antibiotics remain effective.
10. Lower threshold for antibiotics in immunocompromised or those with multiple morbidities; consider culture/specimens and seek advice.
11. Avoid widespread use of topical antibiotics, especially those agents also available systemically; in most cases, topical use should be limited.
12. In pregnancy take specimens to inform treatment. Where possible AVOID tetracyclines, aminoglycosides, quinolones, azithromycin (except in chlamydial infection), clarithromycin, and high dose metronidazole (2g STAT), unless benefits outweigh the risks. Penicillins, cephalosporins and erythromycin are safe in pregnancy. Short term use of nitrofurantoin is not expected to cause foetal problems (theoretical risk of neonatal haemolysis). Trimethoprim is also unlikely to cause problems unless poor dietary folate intake, or taking another folate antagonist. Seek further advice from the [UK Teratology Information Service](#) on ☎ 0344 892 0909 if needed.
13. Avoid all tetracyclines in children under 12 years due to deposition in growing bone and teeth, by binding to calcium, causing staining and occasionally dental hypoplasia.
14. Where there are two clinically appropriate options consider adherence and cost effectiveness.
15. Disabling, long-lasting or potentially irreversible adverse reactions affecting musculoskeletal and nervous systems have been reported very rarely with fluoroquinolone antibiotics. Fluoroquinolone treatment should be discontinued at the first signs of a serious adverse reaction, including tendon pain or inflammation. For further information click [here](#).

Note: Doses are for guidance only. Doses are oral and for adults. Refer to BNF/BNFc (BNFc indicated by [BNFc](#)) for further information.

GENITAL TRACT INFECTIONS				
STI Screening	People with risk factors should be screened for chlamydia, gonorrhoea, HIV, and syphilis. Refer individual and partners to GUM. Risk factors: <25 years; no condom use; recent/frequent change of partner; symptomatic or infected partner; area of high HIV.			
Chlamydia trachomatis/ urethritis	1. Doxycycline	100mg BD	7 days	<ul style="list-style-type: none">• Opportunistically screen all sexually active patients aged 15 to 24 years for chlamydia annually and on change of sexual partner.• If positive, treat index case, refer to GUM and initiate partner notification, testing and treatment.• As single dose azithromycin has led to increased resistance in GU infections, doxycycline should be used first line for chlamydia and urethritis.• Advise patient to abstain from sexual intercourse until doxycycline is completed or for 7 days after treatment with azithromycin (14 days after azithromycin started and until symptoms resolved if urethritis).• If chlamydia, test for reinfection at 3 to 6 months following treatment if <25 years or consider if >25 years and high risk of reinfection.• Second line, pregnant, breastfeeding, allergy, or intolerance: azithromycin is most effective. As lower cure rate in pregnancy, test for cure at least 3 weeks after end of treatment.• Consider referring all patients with symptomatic urethritis to GUM as testing should include <i>Mycoplasma genitalium</i> and <i>Gonorrhoea</i>.• If <i>M. genitalium</i> is proven, use doxycycline followed by azithromycin using the same dosing regimen and advise to avoid sex for 14 days after start of treatment and until symptoms have resolved.
	Second line/pregnant/breastfeeding/allergy/intolerance:			
	2. Azithromycin	1g STAT then 500mg OD	2 days (total 3 days)	
Epididymitis	Doxycycline OR Ofloxacin (consider safety issues) OR Ciprofloxacin (consider safety issues)	100mg BD 200mg BD 500mg BD	10-14 days 14 days 10 days	<ul style="list-style-type: none">• Usually due to Gram-negative enteric bacteria in men over 35 years with low risk of STI.• If under 35 years or STI risk, refer to GUM.
Vaginal candidiasis BASHH Vulvovaginal candidiasis	Clotrimazole OR Clotrimazole OR Fluconazole (oral) <i>Recurrent:</i> Fluconazole (induction/maintenance)	500mg pessary 100mg pessary 150mg capsule 150mg every 72 hours <i>THEN</i> 150mg once a week	STAT 6 nights STAT 3 doses 6 months	Self-care advice: <ul style="list-style-type: none">• Preparations for vaginal candidiasis: available OTC for adults.• All topical and oral azoles give over 80% cure.• Pregnancy: avoid oral azoles, and use clotrimazole 100mg intravaginal treatment for 6 nights.• Recurrent (>4 episodes per year): 150mg oral fluconazole every 72 hours for three doses induction, followed by one dose once a week for six months maintenance.
Bacterial vaginosis BASHH Bacterial vaginosis	Oral Metronidazole OR Metronidazole 0.75% vaginal gel OR Clindamycin 2% cream	400mg BD OR 2g 5g applicator at night 5g applicator at night	7 days STAT 5 nights 7 nights	Self-care advice: <ul style="list-style-type: none">• Preparations for bacterial vaginosis are available OTC that patients may find helpful.• Oral metronidazole is as effective as topical treatment, and is cheaper.• Seven days results in fewer relapses than 2g stat at four weeks.• Pregnant/breastfeeding: avoid 2g dose. Treating partners does not reduce relapse.
Genital Herpes BASHH Anogenital herpes	Oral Aciclovir OR Valaciclovir OR Famciclovir	400mg TDS 800mg TDS (if recurrent) 500mg BD 250mg TDS 1g BD (if recurrent)	5 days 2 days 5 days 5 days 1 day	Self-care advice: <ul style="list-style-type: none">• Advise saline bathing, analgesia, or topical lidocaine for pain, and discuss transmission.• First episode: treat within five days if new lesions or systemic symptoms, and refer to GUM.• Recurrent: self-care if mild, or immediate short course antiviral treatment, or suppressive therapy if more than six episodes per year.

Note: Doses are for guidance only. Doses are oral and for adults. Refer to BNF/BNFC (BNFC indicated by [BNFc](#)) for further information.

South West London

Alternative if above are contraindicated/refused: (oral treatment)		
Erythromycin	500mg BD	Assess after 12 weeks
OR		
Clarithromycin	250mg BD	
OR		
Trimethoprim (following consultant advice, off-label**)	300mg BD	
Children under 12 years:		
Combination of adapalene/benzoyl peroxide (not in under 9's)	0.1%/2.5% OD (thinly in the evening) ^{BNFc}	Review at 6-8 weeks. Continue for 3 months max
<u>Alternative treatment if above is contraindicated or refused †</u>		
Benzoyl peroxide	5% OD – BD ^{BNFc}	
AND IF NEEDED		
Erythromycin	500mg BD ^{BNFc}	
OR		
Clarithromycin	250mg BD (weight ≥ 30kg) ^{BNFc}	
Pregnant women:		
Combination of benzoyl peroxide/clindamycin (to be used with caution)	3%/1% or 5%/1% OD (thinly in the evening)	Review at 6-8 weeks. Continue for 3 months max
<u>Alternative if above is contraindicated, refused †</u>		
Benzoyl peroxide (alone)	5% OD – BD	
AND IF ORAL TREATMENT IS NEEDED		
Benzoyl peroxide	5% OD – BD	
WITH		
Erythromycin (preferred in pregnancy)	500mg BD	
OR		
Clarithromycin	250mg BD	

- Refer to a consultant dermatologist if any of the following apply:
 - there is diagnostic uncertainty
 - they have [acne conglobata](#)
 - they have nodulo-cystic acne
 - they have [acne fulminans](#) (urgent referral to hospital dermatology team to be assess within 24 hours)
- Consider referring to a consultant dermatologist if they have:
 - mild to moderate acne that has not responded to two courses of treatment
 - moderate to severe acne which has not responded to previous treatment that contains an oral antibiotic
 - acne with scarring
 - acne with persistent pigmentary changes
 - acne contributing to persistent psychological distress or a mental health disorder
- To reduce risk of skin irritation with topical treatments, start with alternate-day or short contact application (e.g. wash off after an hour).
- If a person receiving treatment for acne wishes to use hormonal contraception, consider using the combined oral contraceptive pill in preference to the progestogen-only pill
- Review treatment at 12 weeks and in those whose treatment includes an oral antibiotic, consider continuing treatment for up to 12 more weeks if their acne has not completely cleared (either oral and topical treatment, or topical only)
- Only continue antibiotic treatment for more than 6 months in exceptional circumstances. Review every 12 weeks and stop as soon as possible.
- If acne fails to respond adequately to a 12 week course of a first-line treatment option and at review the severity is:
 - mild to moderate: offer another option from the table of treatment choices. If mild to moderate acne fails to respond adequately to 2 different 12 week courses of treatment options, consider referral to a consultant dermatologist-led team
 - moderate to severe, and the treatment did not include an oral antibiotic: offer another option which includes an oral antibiotic from the table of treatment choices
 - moderate to severe, and the treatment included an oral antibiotic: consider referral to a consultant dermatologist-led team.
- Consider maintenance treatment in people with a history of frequent relapse after treatment.
- Consider a fixed combination of topical adapalene and topical benzoyl peroxide as maintenance treatment for acne. If this is not tolerated, or if 1 component of the combination is contraindicated, consider topical monotherapy with adapalene, azelaic acid, or benzoyl peroxide
- Review maintenance treatments for acne after 12 weeks to decide if they should continue.

* Useful in reducing risk of hyperpigmentation in individuals with darker skin

ILLNESS	DRUG	DOSE	DURATION	COMMENTS
DENTAL INFECTIONS				
For suspected dental infections outside a dental setting. Derived from the Scottish Dental Clinical Effectiveness Programme 2011 SDCEP Guidelines . <i>This guidance is not designed to be a definitive guide to oral conditions, as GPs should not be involved in dental treatment. This guidance may be followed if treatment is deemed necessary and the clinician feels competent to do so however patients presenting to non-dental primary care services with dental problems, in the first instance, should be directed to their regular dentist, or if this is not possible, to the NHS 111 service, who will be able to provide details of how to access emergency dental care.</i>				
Note: Antibiotics do not cure toothache. First line treatment is with paracetamol and/or ibuprofen; codeine is not effective for toothache.				
Mucosal ulceration and inflammation (simple gingivitis) SDCEP Dental problems	Simple saline mouthwash	½ tsp salt warm water ^{BNFc}	Always spit out after use	Self-care advice: <ul style="list-style-type: none">Simple saline mouthwash can be prepared at home.Mouthwashes are available OTC.Temporary pain and swelling relief can be attained with saline mouthwash.Use antiseptic mouthwash if more severe, and if pain limits oral hygiene to treat or prevent secondary infection.The primary cause for mucosal ulceration or inflammation (aphthous ulcers; oral lichen planus; herpes simplex infection; oral cancer) needs to be evaluated and treated.
	Chlorhexidine (Do not use within 30 mins of toothpaste)	0.2% mouthwash 1 minute BD with 10 mL ^{BNFc}	Use until lesions resolve or less pain allows oral hygiene	
	Hydrogen peroxide (spit out after use)	6% mouthwash 2-3 mins BD-TDS with 15ml in ½ glass warm water ^{BNFc}		
Acute necrotising ulcerative gingivitis	Chlorhexidine (Do not use within 30 mins of toothpaste) OR	0.2% mouthwash 1 minute BD with 10 mL ^{BNFc}	Until pain allows for oral hygiene	Self-care advice: <ul style="list-style-type: none">Mouthwashes are available OTC.Refer to dentist for scaling and hygiene advice.Antiseptic mouthwash if pain limits oral hygiene.Commence metronidazole in the presence of systemic signs and symptoms.
	Hydrogen peroxide (spit out after use)	6% mouthwash 2-3 mins BD-TDS with 15ml in ½ glass warm water ^{BNFc}		
	If systemic signs and symptoms: Metronidazole	400mg TDS ^{BNFc}	3 days	
Pericoronitis SDCEP Dental problems	Metronidazole OR	400mg TDS ☺	3 days	Self-care advice: <ul style="list-style-type: none">Use antiseptic mouthwash if pain and trismus limit oral hygiene.Mouthwashes are available OTC.Refer to dentist for irrigation and debridement.If persistent swelling or systemic symptoms, use metronidazole or amoxicillin.
	Amoxicillin	500mg TDS ☺	3 days	
	Chlorhexidine (Do not use within 30 mins of toothpaste) OR	0.2% mouthwash 1 minute BD with 10 mL ^{BNFc}	Until pain allows for oral hygiene	
	Hydrogen peroxide (spit out after use)	6% mouthwash 2-3 mins BD-TDS with 15ml in ½ glass warm water ^{BNFc}		
Dental abscess SDCEP Dental problems	Regular analgesia should be the first option until a dentist can be seen for urgent drainage, as repeated courses of antibiotics for abscesses are not appropriate.			Self-care advice: <ul style="list-style-type: none">Analgesia available OTC.Repeated antibiotics alone, without drainage, are ineffective in preventing the spread of infection.Antibiotics are only recommended if there are signs of severe infection, systemic symptoms, or a high risk of complications.Patients with severe odontogenic infections (cellulitis, plus signs of sepsis; difficulty in swallowing; impending airway obstruction) should be referred urgently for hospital admission to protect airway, for surgical drainage and for IV antibiotics.The empirical use of cephalosporins, co-amoxiclav, clarithromycin, and clindamycin do not offer any advantage for most dental patients, and should only be used if there is no response to first line drugs.If pus is present, refer for drainage, tooth extraction, or root canal.Send pus for investigation.If spreading infection (lymph node involvement or systemic signs, i.e. fever or malaise) ADD metronidazole.Use clarithromycin in true penicillin allergy and, if severe, refer to hospital.
	Amoxicillin OR	500mg-1g TDS ^{BNFc}	Up to 5 days; review at 3 days	
	Penicillin V	500mg-1g QDS ^{BNFc}		
	Metronidazole	400mg TDS ^{BNFc}		
	Penicillin allergy: Clarithromycin	500 mg BD ^{BNFc}		

Note: Doses are for guidance only. Doses are oral and for adults. Refer to BNF/BNFc (BNFc indicated by ^{BNFc}) for further information.
